An Introduction to the Methods of Laboratory Physics

This course provides a broad and thorough introduction to the techniques of experimental physics, with emphasis on the laboratory capabilities in our department. It begins with a discussion of those topics that are ubiquitous in research laboratories, including methods of vacuum technology and electronic control of experimental parameters with special attention to feedback control. These are the things one needs to know when first entering a laboratory. In addition, it provides an excellent description of the underlying science behind the experiments in the graduate lab, PHY 515.

There follows a series of distinct units where various members of the experimental research faculty describe the nature of their work, explain the major principles of their laboratory instruments, discuss how these instrument systems function, and conduct tours of their laboratories showing the apparatus in action. The student becomes familiar with most of the experimental research instrumentation in the Department.

Fall semester, 3 credits, S/U grading
# PHYSICS 514 – FALL 2010

**Current Research Instruments**

Lecture: Tθ – 9:50 - 11:10
Room: Physics - P-125
as of August 16, 2010, subject to change
